1	Navigation:									
2	Elementary glide-path calculator (SimpleCalc)				Results worksheet (R. Results)			Next IPT worksheet (Assumptions)		
3										
4	Income Planning Tool (IPT)									
5	Calculate a financial Glide-Path from yearly Cash-flows, Income Streams, Expenses, Investment Accounts and Taxes									
6										
7	This Excel spreadsheet is designed for people who want to plan for future income, saving, and spending needs. It calculates rough									
8	estimates of saving and spending patterns over time. You must enter <i>summaries</i> of a range of your personal financial data as									
9	required by the model. These include applicable investments (taxable and retirement), pension, Social Security, work, annuity,									
10	optiona 529s, and expenses. The final results are shown in summary tables and glide-path graphs for those tables. All data are entered									
11	and calculations are done only in this spreadsheet. No data are exported or saved from the spreadsheet (either locally or to the									
12	Internet). Once the data are entered, the spreadsheet estimates yearly cash-flows using income from various sources: work,									
13	pensions, Social Security, annuities, and life insurance benefits; contributions and withdrawals from tax-deferred 401(k), 403(b),									
14	457(b), IRAs, Roths, and savings investment accounts. The spreadsheet estimates yearly investment returns, taxes on investment									
15	returns, and expenses. It estimates yearly Federal tax rates and resulting cash-flows are estimated. The spreadsheet allows									
16	for scheduled and irregular (upcoming additional) contributions and withdrawals for investment accounts (IRA, Roth, Savings)									
17	as well as for scheduled and irregular expenses and deductions. From this data, the spreadsheet then calculates yearly net worth.									
18	Glide-path tables and graphs are created are useful for investigating different planning scenarios by making changes to inputs.									
19										
20	The IPT software may be run in a variety of spreadsheet programs including Windows Excel, the free OpenOffice or LibreOffice									
21	"calc", Google "sheet". The spreadsheet doesn't use Microsoft Visual Basic as VBA is not available in all spreadsheet									
22	programs. Apple's "numbers" spreadsheet program has some incompatibilities, so use either Excel for Mac or one of the free									
23	spreadsheet programs.									
24										
25	Why model? Although models by nature are imprecise, calculating a rough estimate of your income stream may be useful for									
26	financial planning. The spreadsheet represents a compromise between complexity and completeness and leans in the direction									
27	of a simpler model. As statistician George Box noted, "All models are wrong, but some are useful." To illustrate the concept of									
28	glide-path modeling, a very crude glide-path calculator, "SimpleCalc", is available (both as a worksheet in the IPT spreadsheet and									
29	as a separate spreadsheet). This may be useful for you to experiment with to better understand the concept of glide-path before									
30	using the full IPT spreadsheet, which uses a more complete financial planning model. These spreadsheets are educational tools.									
31										
32	Last revision:	1/18/2017	V.0.27.03	Beta**						

	A	B	C	D	E	F	G	H	I	J
33	See	Appendix D	for the list of outstanding issues (things TODO), and full REVISION-LIST							
34										
35	Note: The spreadsheet will be revised each year after new Tax Tables & Cap-Gains/Div. rates & tax rules are announced.

81											
82	Introduction										
83											
84	The Concept										
85	While saving for future expenditures such as retirement, a new house, or a college education for your children you										
86	might wonder if you are saving enough or spending too much on current expenses. If you are near or in retirement,										
87	the spreadsheet lets you estimate, using a static model, your income stream and whether it will cover your expenses.										
88	It does not use a dynamic model such as those using Monte-Carlo or repeated random sequences of returns methods.										
89	A glide-path analysis lets you look at your finances over time. How do they change with the contributions to savings										
90	during your accumulation phase? How rapidly are your savings being depleted during retirement? How does it change										
91	with changes in your expenses? What happens if you retire early or later than expected? It may be useful to periodically										
92	check how you are doing to make sure you're still on track to reach your goals and, if not, what might be changed										
93	to improve your retirement glide path. This Introduction worksheet gives an overview and a FAQ worksheet										
94	provides answers to some Frequently Asked Questions.										
95											
96	This Income Planning Tool (IPT) spreadsheet lets you enter detailed personal data to help answer those										
97	questions more accurately - both for near term pre- and post-retirement. There are many rudimentary retirement										

98 calculators available on-line (see **RS. Resources** section **RS.8** for a list). To illustrate the flavor of these
 99 types of glide-path calculations, we provide an additional very simple one in the worksheet [SimpleCalc](#)
 100 Note, the SimpleCalc worksheet is used just to introduce the concept of glide-path and is not part of the rest of the
 101 IPT spreadsheet. The following screenshot shows some typical data and results. In this example, the person ran out
 102 of savings at age 86. Their lifestyle with no change in saving, retirement age or expenses in retirement was not
 103 sustainable after age 86.

1. Enter your data in the Red cells below.

Your current age (same as retired if <i>already</i> retired):	25
Your expected retirement age:	67
Current value of savings portfolio:	\$30,000
Current gross annual income (GAI):	\$25,000
Annual contributions to savings portfolio:	\$3,750
Yearly annuity from Social Security at retirement	\$6,000

2. Additional parameters you can adjust or use THE defaults)

Pre-retirement annual rate of return on portfolio:	4.50%
Post-retirement annual rate of return on portfolio:	2.50%
Expected annual income Cost Of Living Adjustment:	2.00%
Increase of annual retirement withdrawals:::	3.00%
Increase in annual contributions to savings portfolio:	2.00%
Percent of GAI needed in retirement when retire:	80%

Savings portfolio value

You run out of savings at age **86**

The value of your savings at retirement **\$770,241**

Percent of income saved while working **15.0%**

Number of years you can fund in retirement **19**

Percent of expenses from Soc. Sec. at retirement **13.3%**

Values for savings and expenses over time

Year	Age	Savings portfolio value	Savings contribution	Gross Annual Income	Cola adjusted Social Security if any	Retired Annual Expenses	Percent expenses from Soc. Sec. In retirement
1	25	\$30,000	\$3,750	\$25,000	\$0	\$0	0.0%
2	26	\$35,269	\$3,825	\$25,500	\$0	\$0	0.0%
3	27	\$40,853	\$3,902	\$26,010	\$0	\$0	0.0%

130 The complete IPT spreadsheet described below provides a much more accurate and detailed analysis because it takes
 131 into account many other financial factors over time. Play with the SimpleCalc "toy" glide-path calculator first. If this looks

	A	B	C	D	E	F	G	H	I	J
132	interesting, then you might try using this IPT spreadsheet. It is described in more detail below. Of course it can't predict									
133	the future but it may provide a better understanding of your financial situation, which may be useful in doing financial									
134	planning.									
135										
136										
137	1. Description of the IPT Spreadsheet									
138										
139	This spreadsheet software computes a rough estimate of yearly income and expense flows as various income sources and									
140	expenses come and go over time. Results are calculated at the end of each year. It uses a yearly "cash flow" calculation									
141	defined as the sum of income and withdrawals, and subtraction of expenses, contributions and estimated taxes. Any									
142	funds left over each year in the cash account are saved back into the investment taxable savings account for the next year.									
143	Similarly, in years with a cash shortfalls, funds are taken from the savings account the next year. The spreadsheet									
144	is an Excel workbook consisting of a number of worksheets containing personal data that you enter. In Excel, the									
145	spreadsheet as a whole is called a workbook which in turn is a collection of worksheets.									
146										
147	Navigating the spreadsheet									
148	In Excel, you switch between worksheets by clicking on a named worksheet tab at the bottom of the Excel window or by									
149	clicking on worksheet hyperlinks (blue font with an underline) available throughout the spreadsheet. You may advance to the									
150	next or previous worksheet by clicking on the Next or Results or Previous links at the top or bottom of each worksheet.									
151	(Prev worksheet) Results worksheet (R. Results) (Next worksheet).									
152	The three hypertext links also appear after the following notice on each data entry worksheet.									
153	! --- > DO NOT CHANGE ANY VALUES in the following tables in this worksheet. < ---									
154	Alternatively, at the bottom of each worksheet there is a Worksheet Navigation table at the end of each									
155	worksheet. It contains a hypertext list of all of sequential worksheet names.									
156										
157	Setting up the spreadsheet									
158	Use the S. Setup worksheet to specify which other worksheets you will need to fill out. The IPT works with one person S1 or two									
159	people called S1 and S2. S1 and S2 may be married or unmarried. However the latter should use the tax filing status Separate Filing .									
160	The R. Results worksheet summarizes data computed on the other data worksheets both as tables and as graphs of the data in the									
161	tables. The results are updated when data is changed in any of the other data entry worksheets.									
162										
163	Depending on your level of expertise and familiarity with financial terms, you may want to review unfamiliar terms in the									
164	Appendix C worksheet (glossary of 'financial terms used in the IPT spreadsheet) before entering your data. The spreadsheet									

	A	B	C	D	E	F	G	H	I	J																																																																												
165	requires switch between the different worksheets that focus on <i>particular</i> types of data (e.g., work income, Social Security																																																																																					
166	benefits, taxable savings, IRAs, Roths, etc.).																																																																																					
167																																																																																						
168	Viewing the Results at any time in the analysis																																																																																					
169	The total summary net worth glide-path results graph is computed in the R. Results worksheet. However it is also viewable																																																																																					
170	in each editable data entry worksheet so users can immediately see the new results of any data entry changes they make.																																																																																					
171	It is located after the end of data entry notice as a graph with light green background.																																																																																					
172	--- > DO NOT CHANGE ANY VALUES in the following tables in this worksheet. < ---																																																																																					
173	<div style="border: 1px dashed green; padding: 10px; margin: 0 auto; width: 80%;"> <p>R. 189																																																																																						
190	Some of the types of personal data that may be required																																																																																					
191	One or more income sources may be defined and include: work income, pensions, Social Security, and annuity payouts. There																																																																																					
192	are three types of investment accounts including: tax-deferred deductible IRA, Roth IRA, and savings (taxable investments), bank																																																																																					
193	bank accounts, and CDs). For purposes of the spreadsheet, 401(k), 403(b), 457(b), Traditional-IRA, Rollover IRAs are considered to																																																																																					
194	be tax-deferred IRAs. Similarly a Roth-401(k) is considered a Roth IRA. This is because after you retire, most retirement accounts																																																																																					
195	may be rolled over to "Rollover-IRA" and Rollover-Roth" accounts. You may make both scheduled and irregular contributions																																																																																					
196	and/or withdrawals to each of the spreadsheet investment accounts. An <u>irregular event</u> is an upcoming one-time event occurring																																																																																					

	A	B	C	D	E	F	G	H	I	J
197	in a particular year (specified by age). You may specify expenses and tax-deductions as both scheduled and irregular events. You									
198	might think about your list of future irregular expenses as a planning tool for your future expenses in your "Bucket List" - such as									
199	college expenses, retirement, trips, gifts, etc. (See the discussion of the 2007 comedy film The Bucket List for a nice definition.)									
200	http://en.wikipedia.org/wiki/Bucket_list . The spreadsheet calculates your remaining assets yearly so you may use this for									
201	helping plan for funding future expenses.									
202										
203	Income sources are: work income, pensions, Social Security, and annuity benefits. Investment accounts include tax-deferred									
204	IRAs, Roth IRAs, as well as savings investment accounts. Contributions, and withdrawals may be specified from investment									
205	accounts. Taxes are then estimated on the total taxable income. All data worksheets require you to specify the age when the									
206	incomes, contributions and withdrawals or expenses start as well as when they end (if applicable).									
207										
208	If the cash-flow is ever negative for a particular year, the spreadsheet takes the shortfall from the taxable savings account									
209	(9. SavingsData) for the next year. If the savings ever run out, this is a problem. It will warn you with an error warning in the									
210	R. Results section R.8 . One could possibly increase some of the income sources (more work, IRA or ROTH withdrawals)									
211	and/or lower expenses to make the cash-flow positive if it were severely negative.									
212										
213										
214	1.1 Examples of some of the questions that may be investigated using this spreadsheet									
215	Here are some examples of questions that might be answered using the IPT. The details on the questions are									
216	described in the appendix FAQ number 13.									
217	Q.1 Will I run out of money during retirement?									
218	Q.2 Will the money being saved for college expenses (or a new home or cars, etc.) be adequate?									
219	Q.3 When should I take withdrawals on my tax-deferred IRAs?									
220	Q.4 When should I retire, claim Social Security, and how will this affect my savings?									
221	Q.5 How will irregular expenses affect my future income stream through retirement?									
222	Q.6 How much more income could I earn long term if I have a more aggressive stock portfolio (more stocks)?									
223	Q.7 What is the effect of different levels of inflation on my savings over time?									
224	Q.8 What would the effect be of adding annuities during retirement? What if I started them at different times?									
225										
226										
227	1.2 Types of personal data required									
228	Specify the starting and ending ages for each income stream (work, pension, Social Security, and/or annuities), and do									
229	this independently for each spouse S1 and S2. Specify the expected average market returns for stock, bonds and cash									

	A	B	C	D	E	F	G	H	I	J
230	(fixed income) in your investment portfolio. Historically, approximately 90% of your portfolio return is determined by your									
231	asset allocation (roughly the stock:bond ratio). In addition, specify (the same or different) Cost Of Living Adjustments									
232	or COLAs for each of these income streams that increase the income and expenses by that percentage each year. Also									
233	specify the expected Consumer Price Index (CPI) that may be used as a default for the various COLAs you need to enter.									
234										
235	Types of Savings									
236	Similarly, specify the age ranges for scheduled investment (IRA, Roth, taxable savings) contributions and withdrawals for S1									
237	and S2. The IRA and Roth accounts are optional, but <u>the savings account is required</u> since it is used to reconcile the cash-flow									
238	and where insurance payouts (if any) are deposited. You may optionally specify either or both scheduled contributions as a									
239	fixed amount and withdrawals as a percentage each year that increase by a COLA if desired. You may also specify optional									
240	irregular contributions and withdrawal events that may occur at any age or have several events the same year independently									
241	for both S1 and S2. For example, one could withdraw money to buy a new car, pay for kids college, take a big trip and buy a									
242	new house at the same year. You specify the age (e.g., 59) rather than the year (e.g., 2019) for the events. It computes the									
243	sum of the scheduled and irregular contributions and withdrawals respectively each year. These are tracked separately for									
244	S1 and S2.									
245										
246	As of version V.0.27.01 of this IPT spreadsheet, there is a new 529 savings worksheet. The 529 account is treated separately									
247	from the rest of the other types of savings (IRA, Roth, Savings). If enabled, the 529 withdrawals are treated as additional income									
248	and the 529 contributions are treated as additional expenses in the CashData worksheet. College expenses are									
249	still entered as just irregular expenses, as they would be if there were no 529 plan. So college expenses are effectively									
250	paid partly from 529 withdrawals and partly from other income sources.									
251										
252	Types of Expenses									
253	Expenses are specified similar to contributions and withdrawals for investment accounts, but as scheduled and irregular									
254	<i>expense</i> events. Whereas yearly investment account withdrawals are added to the cash-flow, expenses are subtracted									
255	from the cash-flow. Specify scheduled and optional irregular deductions that are used for part of the tax calculations.									
256	Otherwise, the starting and stopping ages with an expense COLA are specified. A rough estimate of Federal and State									
257	taxes that are computed are subtracted from the cash account. Note that State taxes are estimated by a fixed percentage,									
258	not as an AGI-dependent, marginal tax rate. Different states may also have various deduction levels associated with different									
259	types of pensions, etc. which are not taken into account.									
260										
261	It may be used by either a single person (S1) or a couple (S1 and S2)									
262	If there is no individual S2, then just <u>enter zeros</u> for all income, contributions, withdrawals, and expenses for S2 entries.									

	A	B	C	D	E	F	G	H	I	J
263	S1 and S2 may be married or unmarried. Married S1 and S2 individuals may use tax filing status of Married Filing Jointly (MFJ)									
264	or Married Filing Separately (MFS). Single individuals may also use Head of Household (HH). However the unmarried S1 and S2									
265	should only use the Tax filing status Single Filing (SF).									
266										
267	Limitations on the types of static types of calculations done in the spreadsheet									
268	The computations use fixed estimates you specify for various parameters including the CPI, COLAs, stock and income returns									
269	whereas in reality these all change year to year, introducing major changes in the actual results. It does not address the problem									
270	of sequence of investment returns that may radically affect long-term returns. The reality is that all future rates of returns, CPIs,									
271	COLAs, tax rates, tax rules and schedules, deduction schedules, etc., are unknown. However, we know they will vary and both									
272	of these factors may greatly affect future results. Better methods such as Monte-Carlo or randomized sequences of actual past									
273	returns may improve the model, but still cannot guarantee returns. These methods are beyond the scope of this spreadsheet.									
274	Black Swan events (See Talib 2010) do happen - think 9/11 and the 2007-2009 Great Recession. These results are really ball-park									
275	estimates, but still may be useful for planning.									
276										
277										
278	1.3 How the spreadsheet works									
279	Each worksheet has INSTRUCTIONS that explain what is needed to be filled out in that worksheet. As data is entered,									
280	remember to save the Excel workbook (spreadsheet) after or during your editing of the various worksheets. Entered data									
281	will not be saved unless you tell Excel (or whatever spreadsheet program you are using) to save it. As you make changes,									
282	saving the spreadsheet often is a good idea to help prevent loss of your data. See section 3. Detailed directions for using the									
283	spreadsheet below for a more detailed description for using the spreadsheet.									
284										
285	First, enter your personal configuration of the spreadsheet using the "S. Setup: worksheet"									
286	First specify which data worksheets apply to you and that you want to use. Go to the S. Setup worksheet to specify the accounts									
287	that apply to your personal situation in section S.1 and either select "used" or "ignored" for each of the worksheet options.									
288	Specify whether to include irregular contributions and withdrawals in the investment and expense accounts in section S.2 .									
289	Finally, specify whether to add scheduled contributions and withdrawals for the investment accounts in table S.3 .									
290										
291	Then enter your Age(s) and Tax data									
292	After editing the S. Setup worksheet, you should edit the 1. AgeData worksheet, and enter basic tax filing data in the 2. TaxData									
293	worksheet.									
294										
295	Then enter your data into the relevant "3. WorkData" through "10. ExpensesData" worksheets									

	A	B	C	D	E	F	G	H	I	J
296	Visit each of the other data-entry worksheets that apply to you and enter your data. Ignore the other ones that may have									
297	zero values for the data. Some worksheets allow the entry of multiple sets of data as a table we call a " <i>Table-GUI</i> " - for example									
298	multiple jobs. (See the glossary in Appendix C for more details).									
299										
300	Finally, view the final results in the "R. Results" worksheet after all your data is entered									
301	After all data is entered, view the results, which are summarized in the R. Results worksheet. The R. Results worksheet presents									
302	intermediate results computed in the rest of the worksheets in a more readable format presenting a global picture of the									
303	glide-paths for the different accounts and computed results on a year-by-year basis.									
304										
305										
306	1.4 Brief list of the worksheets									
307	The worksheets and their Excel tabs are color coded by function. We list the main purpose of the following worksheets.									
308	See each worksheet for more details.									
309										
310	Introduction worksheet is white.				<i>overview documentation of the IPT</i>					
311										
312	SimpleCalc worksheet:		SimpleCalc		<i>elementary glide-path calculator</i>					
313										
314	View a summary of data entered at any point for S. Setup , and 1. AgeData through 10. ExpenseData worksheets.									
315	Assumptions worksheet		Assumptions		<i>summary list of all settings by user in the other worksheets</i>					
316	The Assumptions worksheet is not edited since it summarizes data enter from other worksheets.									
317										
318	Results worksheet:		R. Results		<i>summarizes spreadsheet glide-path results after entering your data</i>					
319	The R. Results worksheet is not edited since it summarizes computed results from the other worksheets.									
320										
321	Configuration worksheets:		S. Setup		<i>used to configure entire spreadsheet (indicate which sheets are used)</i>					
322			1. AgeData		<i>enter age, CPI, market returns, insurance used throughout spreadsheet</i>					
323			2. TaxData		<i>enter Federal tax data and filing status</i>					
324										
325	The income worksheets specify one or more sources of yearly income,									
326	Income worksheets:		3. WorkData		<i>enter current or future work income data, if any</i>					
327			4. Pension Data		<i>enter current or future pension income data, if any</i>					
328			5. SocSecData		<i>enter current or future Social Security income data, if any</i>					

	A	B	C	D	E	F	G	H	I	J
329			6. AnnuityData		enter current or future annuity income data, if any					
330										
331	The investment accounts may be a source of income by taking withdrawals. Contributions to these accounts are an expense.									
332	Investment worksheets:		7. IRAdata		enter tax-deferred IRA accounts data, if any (current or future)					
333			8. RothData		enter Roth IRA accounts data, if any (current or future)					
334			529Data		enter 529 college savings accounts data, if any (current or future)					
335			9. SavingsData		enter taxable savings accounts data, if any (current or future)					
336										
337	The worksheet where you enter your yearly expenses.									
338	Expense worksheet:		10. ExpensesData		enter expenses data (current or future)					
339										
340	The worksheet where the yearly cash-flow is computed (Income + Withdrawals - Contributions - Expenses - Taxes).									
341	The CashData worksheet is not edited.									
342	Cash-flow worksheet:		11. CashData		summarizes the cash flow from the other worksheets					
343										
344	The RMD tables are used with deductible-IRAs and 401(k)-Roth withdrawals is in the RMDtable worksheet.									
345	The RMDtable worksheet is not edited unless the IRS updates its RMD data.									
346	RMD tables worksheet:		12. RMDtable		contains the IRS Required Minimum Distribution data					
347										
348	The remainder of the worksheet contain additional documentation.									
349	Resources worksheet:		RS. Resources		outside resources including books, articles and web sites					
350										
351	Appendix A worksheet:		Appendix A		list of all worksheets tables and sections					
352	Appendix B worksheet:		Appendix B		additional special calculators					
353	Appendix C worksheet:		Appendix C		glossary of terms used in the IPT					
354	Appendix D worksheet:		Appendix D		things TODO and Revision-List history					
355	FAQ worksheet:		FAQ		Frequently Asked Questions					
356										
357	For each of the applicable data worksheets accounts, enter income, contributions and/or withdrawals or expense data									
358	(i.e., ages, amounts, rates of return (ROR), COLAs, etc.). There is a detailed list of all these worksheets tables and sections in									
359	Appendix A.									
360										
361	All worksheets in the spreadsheet are protected except for the red cells where you enter your data									
362	Because entering data in non-red cells might corrupt the spreadsheet, we protect all worksheets except for red cells where									

	A	B	C	D	E	F	G	H	I	J	
363	data is entered. Any worksheet may be unprotected by going into the Excel <u>Format</u> option and clicking										
364	on <u>Unprotect worksheet</u> . For more details on protecting/unprotecting worksheets, see RS. Resources RS.9 Excel resources.										
365											
366											
367	1.5 How the yearly income stream cash-flow and net worth are calculated										
368	Both scheduled and irregular withdrawals taken from the tax-deferred IRA, Roth IRA, and savings accounts are added to the										
369	cash-flow in the 11. CashData worksheet. Both scheduled and irregular Expenses (10. ExpensesData worksheet) and Federal and										
370	State taxes (2. TaxData worksheet) are taken from the cash account. The following equations give a top-level explanation of the										
371	computations. For each year y,										
372											
373	Cash(y) = Income(y) + Withdrawals(y) - SavingsContributions(y) - Expenses(y) - Taxes(y) + Insurance Payout(y)										
374	Withdrawals(y) = SavingsWithdrawals(y) + IRAwithdrawals(y) + ROTHwithdrawals(y)										
375											
376	Then, the cash balance is added (subtracted if negative) to the savings account for the next year,										
377	taking contributions and withdrawals into account										
378											
379	Savings(y+1) = [Savings(y) + SavingsContribution(y) - SavingsWithdrawal(y)] * (1+SAVINGSreturn) + Cash(y)										
380	IRA(y+1) = [IRA(y) + IRAcontribution(y) - IRAwithdrawal(y)] * (1+IRAreturn)										
381	ROTH(y+1) = [ROTH(y) + ROTHcontribution(y) - ROTHwithdrawal(y)] * (1+ROTHreturn)										
382											
383	If large future irregular expenses planned, to minimize taxes you may want to withdraw some of the money over several										
384	years from the tax-deferred IRA and/or taxable savings with high unrealized capital gains. Doing this over several years										
385	prior to the expense may possibly avoid going into a much higher marginal tax bracket. Then when these additional										
386	withdrawals are added to the Cash-flow and then put back into savings. Then the future expenses will be covered and the										
387	Cash-flow will not show a negative amount. There is an option in the 11. CashData worksheet to rebalance spouse S1 and S2										
388	by rebalancing cash between them for a year in which one of them has a negative balance. This is enabled in the Setup S.2										
389	worksheet. If the cash flow for either S1 or S2 is negative, it then subtracts the negative amount from the positive one so										
390	the one with extra cash may help out the other who has a negative balance.										
391											
392	How excess or insufficient cash is handled at the end of each year										
393	Each year, all income and investment withdrawals are "added" into the cash-flow table in 11. CashData worksheet.										
394	Expenses and taxes are "removed" or subtracted from the 11. CashData worksheet. The resulting excess (or shortfall)										
395	is calculated and added or (removed) from the taxable savings in 9. SavingsData. Here is an example to help clarify the										

	A	B	C	D	E	F	G	H	I	J
396	difference between scheduled and unscheduled events. For example, you might schedule yearly withdrawals from the									
397	savings account on either a specific schedule (e.g., 1%/year) or on an irregular basis such as a particular withdrawal for a									
398	new car as a specific dollar amount (e.g., \$22,000).									
399										
400	How life insurance payouts are handled									
401	If there is a life insurance payout for S1 and/or S2 for policies described in 1. AgeData section 1.4 , the payout is added to the income									
402	in 9. SavingsData table 9.4.2.1 tax-free to the savings according to the payee (S1, S2 or Other).									
403										
404										
405	2. The two versions of the IPT spreadsheets you may download: "Demo" or "User"									
406	The spreadsheet is distributed in two different versions depending on whether it has demonstration (demo) data or not.									
407	The demonstration (Demo) version has all data-entry worksheets data set up for demonstration purposes to give									
408	typical examples of reasonable values. However, to make it easier to enter your data, a User version is provided with all									
409	data entry fields set to blank (or \$0 or 0%) as appropriate.									
410										
411	The spreadsheet files are distributed with the name, version number, and revision data as part of the file									
412	The file names for both versions of the " <u>Income Planning Tool</u> " are prefixed with "IPT-".									
413	For example, the <u>version number</u> is indicated as:				V.0.19.2					
414	This is followed by the release date indicated by:				11-8-2015a					
415										
416	a) full demo data			IPT-Demo-V.0.19.2-11-8-2015a.xlsx						
417	b) no demo data			IPT-User-V.0.19.2-11-8-2015a.xlsx						
418										
419	a) The Demo version is the spreadsheet with full demonstration data. It is useful for viewing examples of data you might enter									
420	in all worksheets. In most people's situations, you might only use a few of these types of income sources for your data.									
421	b) The User version of the spreadsheet has no demonstration data and is ready for you to enter your own data. All data									
422	entries are set to either \$0 or 0.0% in all data-entry worksheets. All worksheets are unselected in worksheet S. Setup .									
423										
424	To enter data either override the demonstration (Demo) data version or use the empty User version									
425	Direct the spreadsheet to not use any particular data worksheet by selecting " ignored " in the S. Setup worksheet section S.1 .									
426	It is used to declare the data worksheets that <i>you do want</i> by specifying them as " used ". (Alternatively, the spreadsheet will									
427	ignore data from worksheets by setting the income, contribution or withdrawal amounts etc. data to \$0 to remove them from									
428	the calculations). The investment returns for the investment account (IRA, Roth, and savings accounts) from the									

	A	B	C	D	E	F	G	H	I	J
429	previous year are added to the current year for each of the respective accounts (whether the balance is + or -).									
430	S. Setup section S.2 enables/disables the use of Irregular contributions and withdrawals by selecting									
431	"yes" or "no" . S. Setup worksheet S.3 enables/disables the use of scheduled contributions and withdrawals by									
432	selecting "yes" or "no" .									
433										
434	2.1 Disclaimer									
435	This software models an income stream from several different income sources, investment withdrawals,									
436	expenses, taxes and cash-flows over time. No claim is made to the accuracy, suitability, and correctness of the									
437	algorithms. Also, note that the further out one goes over time, the less accurate any estimates will be. Since the									
438	software uses static models and static rates of return, CPI, etc. that are entered, it will not track actual market values									
439	over time. The software uses only Excel formulas and <i>does not use Visual Basic (VBA)</i> , so may can easily review									
440	all computations as desired. Because it uses generic spreadsheet coding (with no VBA), it will run in a variety of									
441	spreadsheet programs such as Windows Excel, free OpenOffice or LibreOffice "calc", free Google "sheet", etc.. Use this									
442	software at your own discretion and risk as an initial way to think about personal finance problems. This is educational									
443	software. Absolutely no warranty is offered for this software and no responsibility is taken for any errors in. or use of									
444	the software.									
445										
446										
447	3. Detailed directions for using the spreadsheet									
448	This section elaborates on the discussion in the above. " 1.3 How the spreadsheet works " section. The spreadsheet									
449	as distributed with the <u>Demo</u> version has demonstration data entered in red cells through the worksheet. Enter data by overwriting									
450	the demonstration data, or use the <u>User</u> version to enter your data instead (see section 2. above). You might <i>SaveAs</i> your									
451	spreadsheet with a new file name as you make changes. The demonstration data provides examples of answers to give an idea									
452	of typical values. Note that negative numbers are shown as red (\$1,234) rather than -\$1,234, and should not be edited.									
453										
454	The first worksheets you should use to enter your data									
455	First configure the spreadsheet to your personal situation in worksheet						S. Setup	sections S.1 to S.3 . By ignoring		
456	any worksheets you specified in S. Setup section S.1 , the spreadsheet will ignore that data. First, enter data in the							1. AgeData		
457	and the		2. TaxData	worksheets since these are used by the all the other data worksheets. In table S. Setup S.1 declares						
458	the set of data worksheets that are applicable to you, where you select either "use" or "ignore" . In S. Setup section S.2									
459	configure the worksheets to use or not use irregular contributions and withdrawals for investment accounts and the expenses									
460	accounts. In S.3 you configure the spreadsheet to use scheduled contributions and withdrawals for the investment accounts.									
461	Most of the S.2 and S.3 queries require a "yes" or "no" answer with one question using having a "keep" or "remove" query.									

	A	B	C	D	E	F	G	H	I	J
462										
463	Then, enter data in other worksheets									
464	After setting the initial configuration in the S. Setup , 1. AgeData and 2. TaxData worksheets, enter the rest of your									
465	data in the data worksheets 3. WorkData through 10. ExpensesData that you have selected in the S. Setup worksheet (see									
466	section 1.4 above for a list of data entry worksheets). Again, only enter data in the red cells on the worksheets.									
467										
468	3. WorkData, 4. PensionData, 5. SocSecData, 6. AnnuityData, 7. IRAdata, 8. RothData, 9. SavingsData, 10. ExpensesData									
469										
470	If a particular data worksheet does not apply to one of the spouses S1 or S2, or there is no spouse S2, then just enter \$0 for any									
471	income, contribution, withdrawal, etc., amounts for that worksheet. That lets the data be ignored in computing the results from									
472	the various data sources.									
473										
474	Finally, view your results in the "R. Results" worksheet									
475	As you enter the data into the various worksheets, the spreadsheet will automatically recompute values in the other worksheets									
476	that use it to incorporate those changes. In particular, they will be reflected in the R. Results worksheet. You can see									
477	how changes in any worksheet affects the results by going back and forth between the R. Results worksheet and the data worksheet									
478	you are currently working on. In addition, the user entered data is summarized in the Assumptions worksheet.									
479										
480	Experimenting with other configurations after you have entered your personal data									
481	You may model the income stream in various ways using temporary changes in the S. Setup configuration. For example, you could									
482	leave out various income sources such as stopping work early, working longer or going back to work, adding an annuity, adding a									
483	Roth IRA, claiming Social Security at different ages, working longer, taking withdrawals from the IRAs or savings at different									
484	ages, adding or eliminating irregular expenses, reducing average scheduled expenses, etc. See FAQ "13. What types									
485	of questions might be investigated using this spreadsheet?" entry for some suggestions.									
486										
487	Where you may enter data									
488	The color of cells in worksheets indicates whether it is used for data entry or displaying results.									
489	ONLY enter or edit data in RED cells.									
490	ORANGE cells are normally not edited unless the IRS changes various tax rates (do not edit).									
491	BLUE cells are major results or intermediate results (do not edit).									
492	BLACK cells are intermediate computations (do not edit).									
493	GRAY areas of the other worksheets indicate where the analysis has not been implemented yet									

	A	B	C	D	E	F	G	H	I	J
494	and should be ignored.									
495										
496	All data entry is at the top of each of the data entry worksheets. The following message indicates that there is									
497	no editable data below the message.									
498										
499	--- > DO NOT CHANGE ANY VALUES in the following tables in this worksheet. <---									
500										
501										
502	4. A detailed list of all worksheet tables and sections is in Appendix A									
503										
504	Appendix A	is a detailed list of all worksheet tables and sections. As mentioned, it lists those worksheets where								
505	data is entered, those worksheets that may have to be edited when the IRS rules or data changes, a cash-flow table where									
506	income and expenses are tallied, and finally the R. Results worksheet where results are summarized. It may be useful to look									
507	through these lists to familiarize yourself with the type of data that will be needed and what types of results are presented -									
508	or just view the different worksheets. It also lists external resources and various appendices subsections.									
509										
510										
511	5. Notes on the current version of the spreadsheet - what it does and does not handle									
512	See the	FAQ	for details on the what the current version of the spreadsheet does and does not handle include taxes.							
513	How static CPI and returns are handled. How tax-free muni bond income is handled. How RMDs are handled, etc.									Appendix D
514	lists more information about the current status including a list of things TODO and the ongoing REVISION-LIST history.									
515										
516	Elementary glide-path calculator (SimpleCalc)			Results worksheet (R. Results)			Next IPT worksheet (Assumptions)			
517										
518										
519	Worksheet Navigation.									
520	To go to a specific worksheet, click on one of the following:									
521	Introduction									
522	Assumptions									
523	R. Results									
524	S. Setup									

	A	B	C	D	E	F	G	H	I	J
